

Engineering Services 8864 Expand and Update

The 8864 Data Controller Expand and Update Engineering service provides a three-phase process to expand storage capacity and bring your data controller up-to-date.

Expand Your Data Storage:

Our Engineering team will configure the data storage for each channel interval as follows:

- 1 minute, 6 minute, and 15 minute averages, storage increased to 60 days
- 1 hour (or higher) increased to 365 days
- Calibration records will be increased to 120 records

To achieve these results, a three-phase process is used.

The Expand and Update Process:

- **Reconciliation** - Capture differences in the controller vs. the configuration stored at the server
- **Update Firmware** - Upgrade the 8864 firmware to the latest general release available
- **Expand Storage** - Make the configuration changes necessary to increase channel storage

An Expand and Update project is proposed at 12 hours fixed price per data controller and is intended for a single 8864 Data Controller, but multiple controllers can be scheduled in the same proposal process. The work can be done either remotely at the fixed price or onsite with an additional mobilization fee.
